Cosmic Ether, Possessing Electric-Tension and Magnetic-Resistance, Is the Unified Field for Physics - 2021 (Vesmírný éter mající elektrické napětí a magnetický odpor je sjednocené pole pro fyziku)

- [Článek](#) +

kopie

... physics is already and effectively unified by the energetic tension field, ether. We identify this integrating power of ether first, by re-defining the action generating parameters of this energetic tension field as the electric-tension, ϵ_0^{-1} , and the magnetic-resistance, μ_0 , while re-deriving the Maxwell's wave equation in analogy with the mechanically stretched string, where the $c_0^2 = \epsilon_0^{-1} / \mu_0$. Then, replacing c_0^2 by ϵ_0^{-1} / μ_0 and m_0 by $E/c_0^2 = E(\mu_0 / \epsilon_0^{-1})$, one can find that almost all working physics theories are being energized by ϵ_0^{-1} and μ_0 . To complete the unification, we can now postulate that the particles are also freely propagating EM waves, but they are spatially localized as in-phase, close-looped (IP-CL) vortex-like propagation modes of ether. Because of their IP-CL mode structure, they have space-finite spatial structures and remain spatially stationary in the absence of any spatially influencing potential gradients (forces) in their vicinity.

... the universe is one continuum.

... old ether is, most likely, the best unifying field for us. We ourselves are just bundles of oscillating, or dancing, excited states of ether!
